

Cargill and Nestlé Purina partner on regenerative agriculture adoption to reduce carbon footprint of Purina dry pet food products

17 April 2024 | News

Investment in regenerative agriculture is estimated to reduce the carbon footprint of Purina's U.S. grain supply from Cargill by up to 40 percent over the next three years

Investment in regenerative agriculture is estimated to reduce the carbon footprint of Purina's U.S. grain supply from Cargill by up to 40 percent over the next three years

A new partnership between Cargill and Nestlé Purina will support the adoption of regenerative agriculture practices across more than 200,000 acres of corn and soy farmland in the Midwest and is estimated to reduce the carbon footprint of the Purina grain supply from Cargill by up to 40 percent over the next three years. Cargill has advanced regenerative agriculture practices on 880,000 acres of North American farmland since 2020. This supports the company's vision to make regenerative agriculture commonplace across its global supply chains—helping farmers to produce food more sustainably while increasing their productivity and resiliency.

Nestlé Purina is investing in farmer adoption of regenerative agriculture practices across the company's corn and soy supply chains through a new partnership with Cargill, one of the largest ingredient and agricultural solutions companies in the U.S. This work will support soil health and reduce the carbon footprint for Purina dry pet food products across North America, contributing to a more sustainable future for people and their pets.

The partnership is expected to support the adoption of regenerative agriculture practices across more than 200,000 acres of corn and soy farmland in the Midwest and is estimated to reduce the carbon footprint of the Purina grain supply from Cargill by up to 40 percent over the next three years.

“Our vision is to make regenerative agriculture commonplace across the industry,” said **Stewart Derechin**, vice president, global partner leader, Cargill. “Through partnerships with customers like Nestlé Purina, we are helping farmers produce food more sustainably while also increasing the productivity and resilience of their farms. We’re working to scale these practices to more than 10 million acres of North American farmland by 2030 to reduce the carbon footprint of the U.S. agriculture and food supply chain and build a more resilient food system.”

This partnership is one way Nestlé Purina is making progress toward its global ambition to reduce carbon emissions and help advance regenerative food systems across its supply chain. Purina is investing to support farmers across several states in the Midwest as they transition to regenerative agriculture practices such as cover cropping, no/low tillage, crop rotation, nutrient management and soil erosion control.
