

Biome Makers Launches New Agronomic Insights Tool BeCrop Farm

30 July 2024 | News

Biome Makers, a leading global agtech company on a mission to recover soil health and improve farmer profitability, has announced the latest evolution of BeCrop technology. BeCrop Farm is the first digital platform designed to maximize the potential of every acre. This innovative solution evaluates over 1,000 parameters, including complex biological data and environmental factors, to provide precise input recommendations and tailored agronomic insights on soil health, disease risk, and management practices.

Biome Makers, a leading global agtech company on a mission to recover soil health and improve farmer profitability, has announced the latest evolution of BeCrop technology. [BeCrop Farm](#) is the first digital platform designed to maximize the potential of every acre. This innovative solution evaluates over 1,000 parameters, including complex biological data and environmental factors, to provide precise input recommendations and tailored agronomic insights on soil health, disease risk, and management practices.

For nearly a decade, Biome Makers has led the industry in building the largest global soil microbe database and scientifically verifying the claims of over 400 biological input products and management practices from ag input manufacturers, retailers, and other agribusinesses around the globe. Biome Makers has now taken a step further to revolutionize agriculture by empowering the industry with real actionable insights to save time and money and recover soil health.

With the increasing adoption of biological products and the expanding options available to farmers each season, proven and precise product recommendations are becoming essential for ensuring consistent performance and ROI. BeCrop Farm addresses this by eliminating guesswork and providing farmers and retailers with tools to help them choose the right products and receive agronomic insights and recommendations that are easy to visualize and implement.

“Understanding the impact of products and management practices on soil is complex and most often requires experienced scientists and agronomists to make sense of the data,” said Alberto Acedo, co-founder and CSO at Biome Makers. “BeCrop Farm combines biological, chemical, and environmental data and utilizes advanced AI to provide farmers and

retailers with an actionable recommendation to make informed decisions and maximize impact.â
