### Sistema.bio secures \$15M in additional financing to accelerate global expansion

### Sistema.bio secures \$15M in additional financing to accelerate global expansion

Sistema.bio, a global leader in biogas technology, has secured a package of \$15 million in financing to fuel its global growth. The company has grown its sales by over five times in the last three years, driven by deep climate, economic and health impacts for farmers worldwide. The current funds will support the continued growth of its partnerships, markets served and range of bioenergy products delivered to farmers.

Led by Electrifi, managed by the EDFI Management Company, the financing was completely funded by Sistema.bio's existing investors and will cover a variety of growth and diversification goals ahead of Sistema.bio's anticipated Series C financing in 2025. A large portion of Sistema.bio's existing equity investors participated in the financing, including Chroma Impact Investment, KawiSafi Ventures, AXA IM Alts, Blink CV, and EcoEnterprises Fund. Additional financing was provided by existing lenders FMO, Triodos and EcoEnterprises as extensions to existing facilities. BIX Capital, and UK Charity Shell Foundation provided the catalytic junior debt, co-funded with UK aid from the UK Government.

"This strategic investment underscores the confidence of Sistema.bio's investors in the company's mission to scale up its transformative impact across Asia, Africa and Latin America," said Joyce Chacho, Independent Board Chair at Sistema.bio.

Building on 2021 Series B funding, the financing package in 2024 is designed to fund growth and unlock additional external capital. This will further fuel Sistema.bio's expansion and innovation in its efforts to provide affordable, sustainable energy and regenerative agricultural solutions to family farmers worldwide.

Liesbet Mijlemans, Senior Investment Officer at EDFI Management Company. "Their technology not only provides clean energy but also boosts agricultural resilience, which is critical in underserved regions."

Sistema.bio's innovative biogas technology transforms animal waste into clean biogas for cooking, heating, and electricity generation, while also producing nutrient-rich biofertilizer that boosts agricultural productivity. Leveraging advanced data tracking platforms, Sistema.bio enhances its impact by delivering high-quality carbon mitigation, sequestration, and climate change adaptation programs. These initiatives aim at contributing to the decarbonization of agriculture and supporting a shift towards regenerative farming practices. With operations **across three continents**, Sistema.bio has positively transformed the lives of over 100,000 farms and more than 600,000 people worldwide, while reducing over 1 million tons of CO<sub>2</sub>e emissions annually.

Alexander Eaton, CEO and co-founder of Sistema.bio, said "The continued trust of ElectriFI and our coalition of investors allows us to focus on our work of engaging millions of farmers to help fight the climate crisis and deliver food security. We are now better positioned to reach our goal of empowering one million farmers by 2025, and reducing 1% of global emissions by 2030."

Over the past decade, Sistema.bio has grown into one of the largest integrated renewable energy and agricultural technology companies in the world focused on small-scale agriculture, with more than 100,000 biogas units installed to date operating in over 35 countries. This latest investment round will enable the company to further scale its operations, enhance its technology, and improve customer service offerings. This funding allows Sistema.bio to accelerate its mission of creating value from waste and delivering clean energy and organic fertilizer to smallholder farmers, installing regenerative agricultural systems and improving livelihoods globally.
