APH continues to work alongside its partners to enhance modern agriculture production and ensure a sustainable future for food production

Acadian Plant Health (APH) recently announced the first results of its California almond water use study, which offers promising news for tree nut growers and the almond industry in the drought-affected growing region.

In 2021, the University of California study found that applications of Acadian Organic were beneficial for reducing plant stress under limited water conditions and that when used properly, seaweed-based biostimulants have the capability to help combat drought-induced changes in plants. Both findings represent a significant boost for growers looking for sustainable agriculture solutions in the face of drought challenges.
